

IMPROVING RAPIDO

Company background and problem statement

Rapido is an auto and bike ride-hailing platform, currently running operations in more than 100 cities in India. Founded in 2015, the company's 1.5 million captains (driver-partners) serve more than 15 million registered customers with their services, accumulating well over 50 million rides and a total of over 250 million kilometers.

Rapido is in its growth phase and it operating in a market where Ola and Uber are dominant players.

Thorough customer research has provided insights that users constantly switch between Uber, Ola, and Rapido while booking an auto, and finalizing the booking which provides the perfect combination of price and expected time of arrival at their doorstep.

We wish to launch 2-3 new features in the current app, which can reduce the switching of users, and make sure they stick to our app.

Competition benchmarking

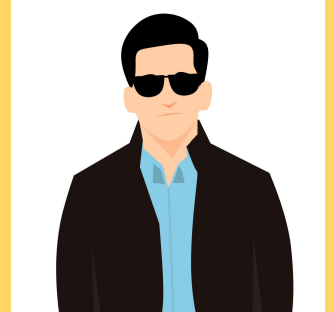

Features	Uber	Ola	Rapido

Insured rides	Y	Y	Y
Additional insurance services	N	Y	N
Payment services (integration with other apps)	N	Y	N
Package delivery services	Y	N	Y

User personas: Riders

User 1: Rishabh

- 26, Fresh MBA graduate, posted in a tier 2 city
 - Travels daily from his rented flat to his work place and back. Finds it cumbersome booking an auto everyday
 - Has to do market visits as part of his work, which takes him to new locations most of the days
 - Doesn't know most of the places he travels to, and finds it challenging to direct drivers to his location as he doesn't know the landmarks in a new place
- Solution: Provide regular scheduled services and share live location

User 2: Divya

- 24, works for an IT company and lives in a flat alone
 - Has her grandparents visit her occasionally from the other part of town
 - She wants them to safely travel to and from her place
- Solution: Book for others

User 3: Ram Nikunj

- Divya's grandfather, 72, retired from government service
 - Lives with his wife, and has his granddaughter living in other part of town whom he wants to visit frequently without bothering her
 - Is not a tech-wizard, but is eager to learn and likes to do things by himself.
 - Has trouble understanding if he has to pay cash at the end of the ride or if payment will be taken online
- Solution: Simplifying the UI, Introduce pay later option

User personas: Drivers

User 1: Sunder Lal

- Lives in a tier 2 city, has been doing well for himself as a Rapido/Uber/Ola driver for the past 2 months
- Has shifted to a new city, so doesn't know its localities that well.
- Complains that it is difficult to locate riders when picking them up, especially older generation
- Solution: Riders can share live location to drivers for easier reachability

User 2: Harish

- Has been driving Rapido/Uber/Ola auto for 4 years
- Complains about no help from the companies to drivers in conflict resolution. Solutions are always biased towards riders
- Solution: Dedicated customer service line for drivers in order to sort out their problems on priority without the need to raise tickets first.

Possible feature additions

Feature (Riders)	Details	Problems targeted
Share live location with driver	Option for users to share their live locations with the driver before starting the trip.	Riders who are unaware of their surroundings can be found by drivers in case they have wandered away from the pickup point or are unable to be present at the designated pickup point. Drivers in general are more aware of the localities and can reach the rider easily in case they have their live locations accessible
Pay later option	Option for users to make payment before next ride instead of the current limit of within 2 minutes of ending the current ride To avoid accumulation of debt on the company, there can be a limit to the ride amount that is eligible for the pay later option, which can later be increased on good credit behaviour	In case of online payments, when user is in a hurry or is unable to receive network in their phones, they should have the option to pay later, before being able to book their next ride. This feature can be expanded later to credit based payment like Ola PostPaid
Book for others	Option to book ride for riders who do not have the mobile app	Helps people who do not have the mobile app or are unable to book the ride by themselves. E.g. for older people or for people who cannot access the internet due to some reason
UI simplification	Simplify the UI during and at the end of the rides to make it cleaner and easier to use	Will avoid information overload, help less tech friendly people to operate the app and make them more likely to use our services
Rapido Regular	Schedule regular services between fixed source and destinations at fixed timings	Will avoid the hassle of making new bookings everyday as the app will do that for you everyday at the specified time between the given locations. There can be an option to update timings or locations within a specified window, if required

Feature (Drivers)	Details	Problems targeted
Dedicated customer service	There will be a different customer service team for taking care of driver concerns Or the current team will take driver concerns on priority without the need for them raising tickets	Drivers will feel valued and will reassure them that their concerns are as important to us as the riders

Analysis of solutions proposed

Feature	Reach (0-10000)	Impact (1-5)	Confidence (1-5)	Effort (1-5)	Final score	Success metrics
Share live location with driver	6000	2	3	1	36000	Turnaround time to reach rider
Pay later option	8000	5	4	4	40000	NPS, App downloads, Churn, MAU/DAU
Book for others	8000	3	3	3	24000	NPS, App downloads, MAU/DAU
UI simplification	10000	2	3	2	20000	NPS, App downloads, Churn
Rapido Regular	5000	4	5	4	25000	NPS, App downloads, MAU/DAU
Dedicated customer service for drivers	5000	4	2	4	10000	Increase in Rapido captain workforce, NPS (drivers), App downloads

Solutions to be implemented

Rapido Regular

"A user opting for regular service on a fixed route should not have to worry about finding a new ride every time"

Examples are:

- Students going to tuition/school
- Working professional commuting to and from home and office

Define MVP:

- **New menu item:** Define details like source, destination, start date and time and frequency
- The **payment option can only be Rapido Wallet.** PostPaid wallet can also be added later if the company starts a PostPaid option later
- Ride details like source, destination and time can only be edited **until 15 minutes** before the next scheduled ride
- **Alert for low wallet balance**, so that the user can continue uninterrupted services. This alert is triggered by the wallet balance falling below the amount payable for the next scheduled ride

Share live location

"A driver or rider who is unfamiliar with their surroundings should be able to find their rides easily"

Examples are:

- Person trying to find their cab in a crowded place
- Rapido captain trying to navigate to the pickup point in a location full of alleys and small parallel streets

Define MVP:

- **Add a new widget** to the ride navigation screen to give the rider the option to share their location with the Rapido captain
- **Alert to the Rapido captain** that the rider's location has been shared. **Marker will be added** to his in-app map that will show the pickup location as well as current location of rider

Pay Later

"In a cashless environment, a rider who is in a hurry or is unable to receive network enough to make a payment on the spot should have the chance to make the payment later"

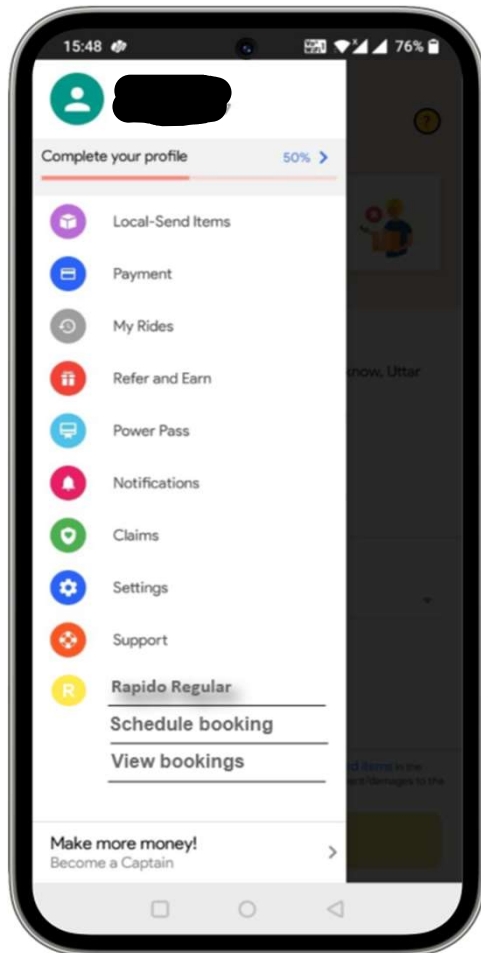

Examples are:

- Work professional heading to their office
- People visiting locations where they are unable to get network or make online payment

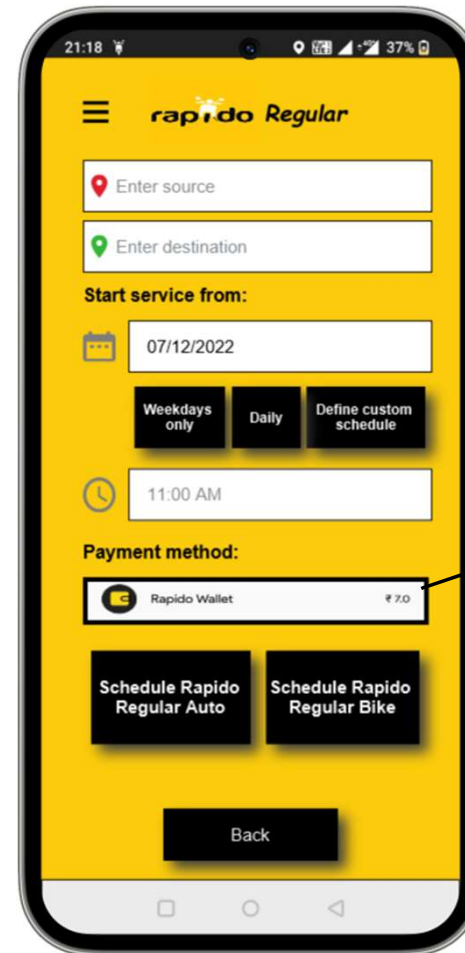

Define MVP:

- Starting with a decided limit (e.g.: ₹ 100), the riders whose total payable amount falls below this limit should be **shown the option of making the payment later.** But this payment should necessarily be made before the user can book his next ride.
- **User should be shown alert on the book a ride page** that he has to make the payment in order to make the next booking
- Good credit behaviour (timely payments of previous bookings should be rewarded with **increase in credit limit** of the user)

Wireframes - Rapido Regular

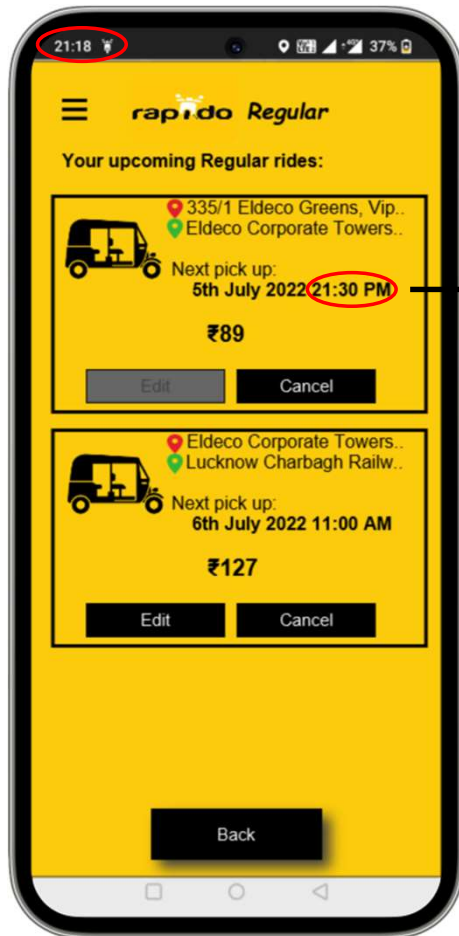

New Menu item to schedule booking and view current bookings

Payment method will be limited to Rapido wallet in order to not bug the rider after every ride

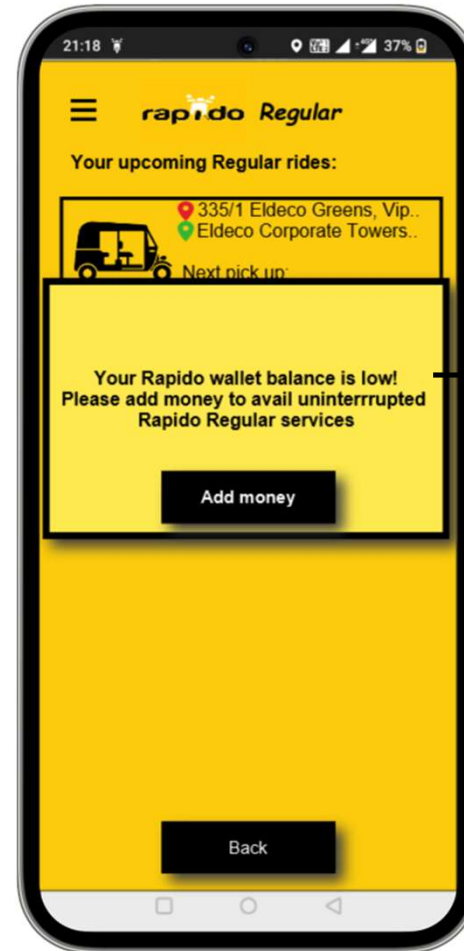

Rapido Regular Schedule booking page

Wireframes - Rapido Regular

Rapido Regular View bookings page

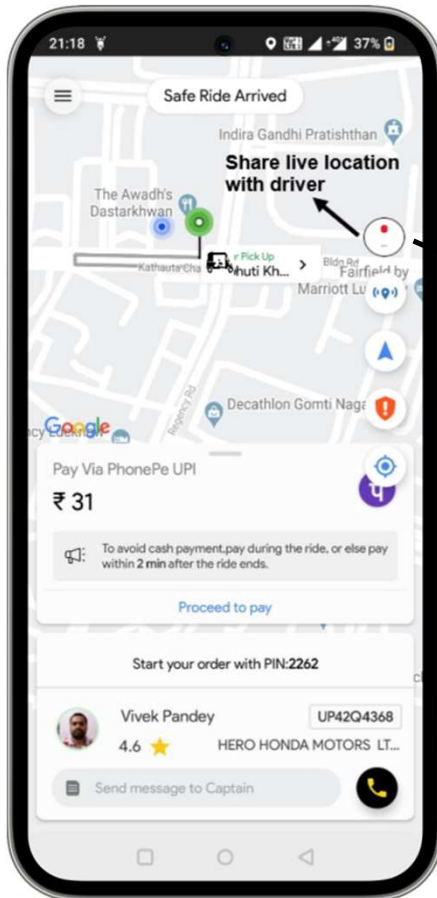

Edit option not available if the ride is scheduled in the next 15 minutes. This is because the app will run the Fetch ride process on the backend 15 minutes before the designated pickup time. In such cases only cancel is available.

Rapido Regular wallet balance alert

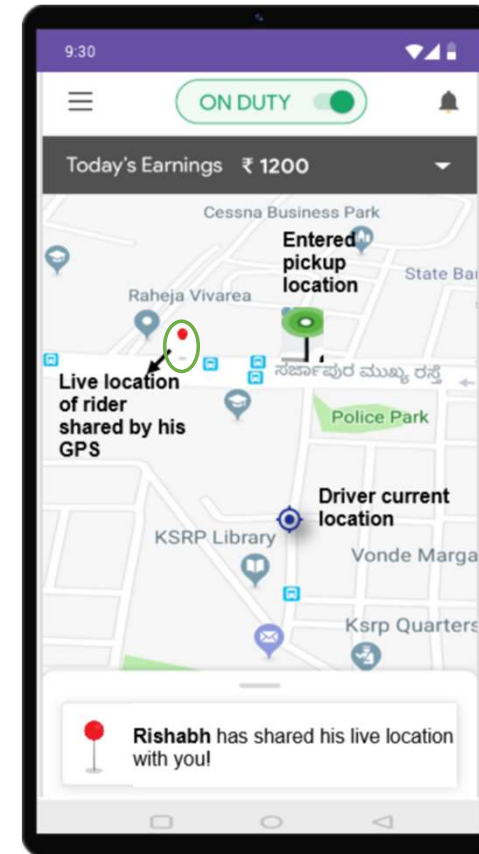

The alert for low wallet balance pops up by the triggering of the event: Wallet balance is lower than the total amount payable for the next scheduled ride

Wireframes – Share live location

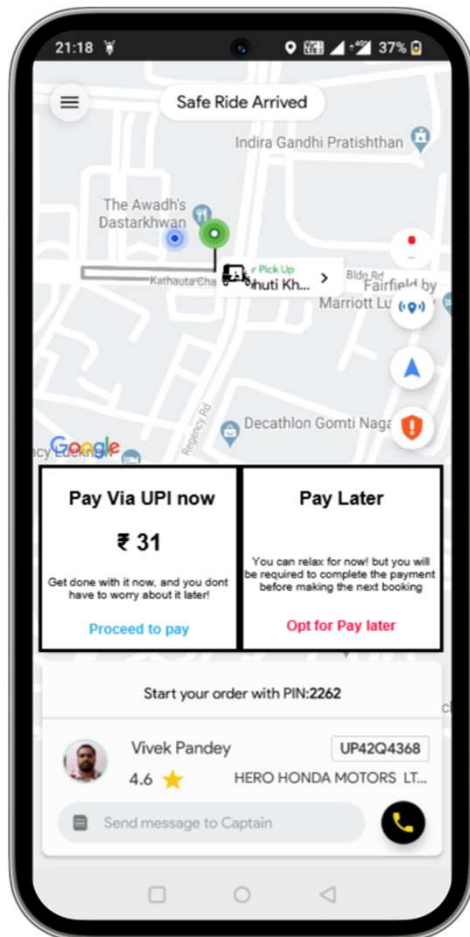

Widget added for rider to share his live location to the driver

Widget added to current booking screen

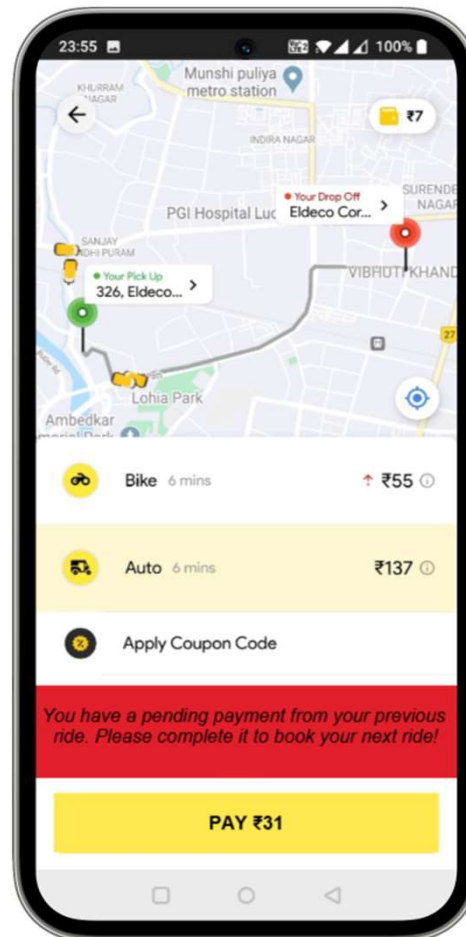

Driver alert and rider live location shared

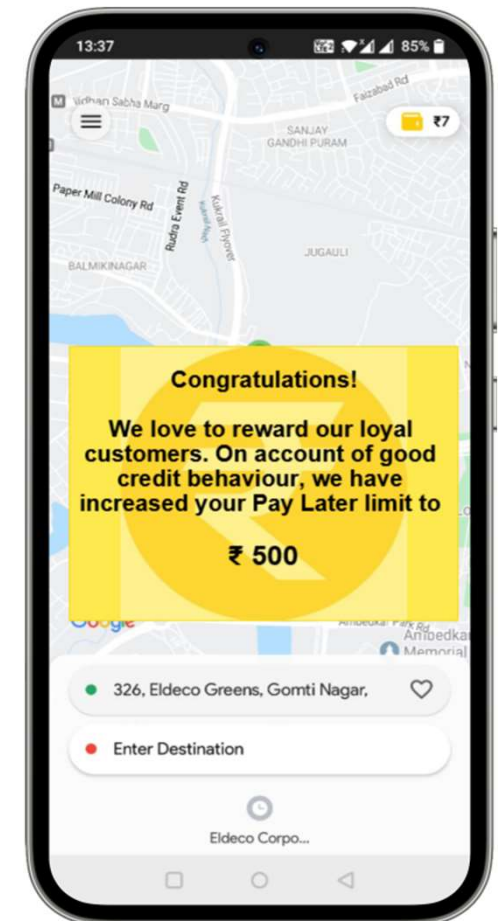

Wireframe – Pay later option

Pay later option shown to eligible users

Mandatory payment to be made before booking next ride

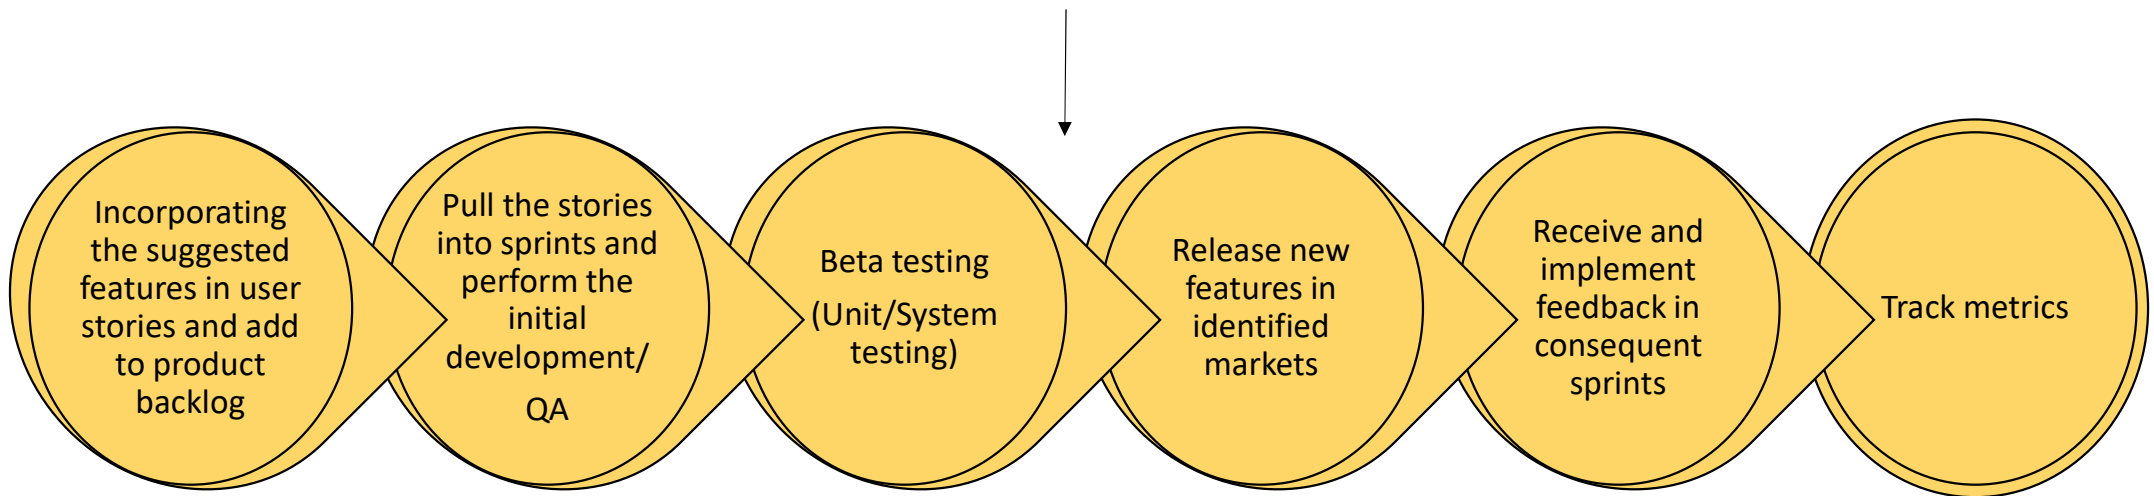

Alert for increase in credit limit of user

Success metrics

- **Turnaround time to reach the rider:** % reduction in the time taken by the Rapido captains to reach the rider for pickup
- **Daily and monthly average users (DAU/MAU):** % increase in the number of users engaging with the application
- **Net promoter score (NPS):** % increase in Play store/App store reviews
- **App downloads:** % increase in app downloads will indicate an increase both in the number of captains and riders
- **Churn rate:** % reduction in the users who are not engaging with our services. This can be tracked at various points of the user journey. For example, searching but not booking, Booking but cancelling, etc.

Go-to market plan

Market research to identify suitable markets for testing new features and response of users

The features to be incorporated would be better suited to an AGILE development framework, where there are subsequent iterations of development and incorporation of user feedback and it will be easier to add newer features. E.g.: integration of PostPaid feature into Rapido Regular if the company moved towards it

Thank you!
